

TXS0108E 8-Bit Bi-directional, Level-Shifting, Voltage Translator for Open-Drain and Push-Pull Applications

1 Features

- No direction-control signal needed
- Maximum data rates
 - 110 Mbps (push pull)
 - 1.2 Mbps (open drain)
- 1.4 V to 3.6 V on A port and 1.65 V to 5.5 V on B port ($V_{CCA} \leq V_{CCB}$)
- No power-supply sequencing required – either V_{CCA} or V_{CCB} can be ramped first
- Latch-up performance exceeds 100 mA per JESD 78, Class II
- ESD protection exceeds JESD 22 (A Port)
 - 2000-V human body model (A114-B)
 - 150-V machine model (A115-A)
 - 1000-V charged-device model (C101)
- IEC 61000-4-2 ESD (B port)
 - ± 8 kV contact discharge
 - ± 6 kV Air-gap discharge

2 Applications

- Handsets
- Smartphones
- Tablets
- Desktop PCs

3 Description

This device is an 8-bit non-inverting level translator that uses two separate configurable power-supply rails. The A port tracks the V_{CCA} pin supply voltage. The V_{CCA} pin accepts any supply voltage between 1.4 V and 3.6 V. The B port tracks the V_{CCB} pin supply voltage. The V_{CCB} pin accepts any supply voltage between 1.65 V and 5.5 V. Two input supply pins allows for low Voltage bidirectional translation between any of the 1.5 V, 1.8 V, 2.5 V, 3.3 V, and 5 V voltage nodes.

When the output-enable (OE) input is low, all outputs are placed in the high-impedance (Hi-Z) state.

To ensure the Hi-Z state during power-up or power-down periods, tie OE to GND through a pull-down resistor. The minimum value of the resistor is determined by the current-sourcing capability of the driver.

Device Information⁽¹⁾

PART NUMBER	PACKAGE	BODY SIZE (NOM)
TXS0108EPW	TSSOP (20)	6.50 mm × 6.40 mm
TXS0108ERGY	VQFN (20)	4.50 mm × 3.50 mm
TXS0108EZX	UFBGA (20)	3.00 mm × 2.50 mm
TXS0108ENME	NFBGA (20)	3.00 mm × 2.50 mm

(1) For all available packages, see the orderable addendum at the end of the datasheet.

4 Revision History

Changes from Revision G (April 2020) to Revision H	Page
• Changed V_{CCB} MAX from 5.5 V to 6.5 V in Absolute Maximum Ratings table	5
Changes from Revision F (January 2019) to Revision G	Page
• Added NME package (NFBGA)	1
• Changed V_{CCA} MIN from 1.2 to 1.4 V in the Recommended Operating Conditions table	6
Changes from Revision E (February 2018) to Revision F	Page
• Changed T_A from 125°C to 85°C in the <i>Recommended Operating Conditions</i> table	6
Changes from Revision D (February 2016) to Revision E	Page
• Added junction temperature	5
Changes from Revision C (December 2014) to Revision D	Page
• Made changes to <i>ESD Ratings</i>	1
Changes from Revision B (November 2013) to Revision C	Page
• Added <i>Pin Configuration and Functions</i> section, <i>ESD Ratings</i> table, <i>Feature Description</i> section, <i>Device Functional Modes</i> , <i>Application and Implementation</i> section, <i>Power Supply Recommendations</i> section, <i>Layout</i> section, <i>Device and Documentation Support</i> section, and <i>Mechanical, Packaging, and Orderable Information</i> section	1

The exposed center pad, if used, must be connected as a secondary ground or left electrically open.

Pin Functions

PIN NO.			TYPE ⁽¹⁾	DESCRIPTION
NAME	PW, RGY	ZXY, NME		
A1	1	B1	I/O	Input/output 1. Referenced to V_{CCA}
A2	3	A2	I/O	Input/output 2. Referenced to V_{CCA}
A3	4	B2	I/O	Input/output 3. Referenced to V_{CCA}
A4	5	A3	I/O	Input/output 4. Referenced to V_{CCA}
A5	6	B3	I/O	Input/output 5. Referenced to V_{CCA}
A6	7	A4	I/O	Input/output 6. Referenced to V_{CCA}
A7	8	B4	I/O	Input/output 7. Referenced to V_{CCA}
A8	9	A5	I/O	Input/output 8. Referenced to V_{CCA}
B1	20	C 1	I/O	Input/output 1. Referenced to V_{CCB}
B2	18	D2	I/O	Input/output 2. Referenced to V_{CCB}
B3	17	C2	I/O	Input/output 3. Referenced to V_{CCB}
B4	16	D3	I/O	Input/output 4. Referenced to V_{CCB}
B5	15	C3	I/O	Input/output 5. Referenced to V_{CCB}
B6	14	D4	I/O	Input/output 6. Referenced to V_{CCB}
B7	13	C4	I/O	Input/output 7. Referenced to V_{CCB}
B8	12	D5	I/O	Input/output 8. Referenced to V_{CCB}
GND	11	C5	—	Ground
OE	10	B5	I	Tri-state output-mode enable. Pull OE low to place all outputs in 3-state mode. Referenced to V_{CCA} .
VCCA	2	A1	P	A-port supply voltage. $1.4\text{ V} \leq V_{CCA} \leq 3.6\text{ V}$, $V_{CCA} \leq V_{CCB}$.
VCCB	19	D1	P	B-port supply voltage. $1.65\text{ V} \leq V_{CCB} \leq 5.5\text{ V}$.
Thermal Pad			—	For the RGY package, the exposed center thermal pad must be either be connected to Ground or left electrically opened.

(1) I = input, O = output, I/O = input and output, P = power

6 Specifications

6.1 Absolute Maximum Ratings⁽¹⁾

over operating free-air temperature range (unless otherwise noted)

		MIN	MAX	UNIT
Supply voltage, V_{CCA}		–0.5	4.6	V
Supply voltage, V_{CCB}		–0.5	6.5	V
Input voltage, V_I ⁽²⁾	A port	–0.5	4.6	V
	B port	–0.5	6.5	
Voltage applied to any output in the high-impedance or power-off state, V_O ⁽²⁾	A port	–0.5	4.6	V
	B port	–0.5	6.5	
Voltage applied to any output in the high or low state, V_O ^{(2) (3)}	A port	–0.5	$V_{CCA} + 0.5$	V
	B port	–0.5	$V_{CCB} + 0.5$	V
Input clamp current, I_{IK}	$V_I < 0$		–50	mA
Output clamp current, I_{OK}	$V_O < 0$		–50	mA
Continuous output current, I_O		–50	50	mA
Continuous current through V_{CCA} , V_{CCB} , or GND		–100	100	mA
Junction temperature, T_J			150	°C
Storage temperature, T_{stg}		–65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) The input and output negative Voltage ratings may be exceeded if the input and output current ratings are observed.
- (3) The value of V_{CCA} and V_{CCB} are provided in the recommended operating conditions table.

6.2 ESD Ratings

		VALUE	UNIT
$V_{(ESD)}$ Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±2000	V
	Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	±1000	
	Machine model (MM)	±150	
	IEC 61000-4-2 ESD (B Port) Contact Discharge	±8000	
	IEC 61000-4-2 ESD (B Port) Air-Gap Discharge	±6000	

- (1) JEDEC document JEP155 states that 500 V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250 V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)⁽¹⁾⁽²⁾

					MIN	MAX	UNIT
V _{CCA}	Supply voltage ⁽³⁾				1.4	3.6	V
V _{CCB}	Supply voltage ⁽³⁾				1.65	5.5	V
V _{IH}	High-level input voltage	A-Port I/Os	V _{CCA} (V) = 1.4 to 1.95	V _{CCB} (V) = 1.65 to 5.5	V _{CCI} – 0.2	V _{CCI}	V
			V _{CCA} (V) = 1.95 to 3.6	V _{CCB} (V) = 1.65 to 5.5	V _{CCI} – 0.4	V _{CCI}	
		B-Port I/Os	V _{CCA} (V) = 1.4 to 3.6	V _{CCB} (V) = 1.65 to 5.5	V _{CCI} – 0.4	V _{CCI}	V
			OE	V _{CCA} (V) = 1.4 to 3.6	V _{CCB} (V) = 1.65 to 5.5	V _{CCA} × 0.65	V
V _{IL}	Low-level input voltage	A-Port I/Os	V _{CCA} (V) = 1.4 to 1.95	V _{CCB} (V) = 1.65 to 5.5	0	0.15	V
			V _{CCA} (V) = 1.95 to 3.6	V _{CCB} (V) = 1.65 to 5.5	0	0.15	
		B-Port I/Os	V _{CCA} (V) = 1.4 to 3.6	V _{CCB} (V) = 1.65 to 5.5	0	0.15	V
			OE	V _{CCA} (V) = 1.4 to 3.6	V _{CCB} (V) = 1.65 to 5.5	0 V _{CCA} × 0.35	V
Δt/Δv	Input transition rise or fall rate	A-Port I/Os Push-pull	V _{CCA} (V) = 1.4 to 3.6	V _{CCB} (V) = 1.65 to 5.5		10	ns/V
		B-Port I/Os Push-pull	V _{CCA} (V) = 1.4 to 3.6	V _{CCB} (V) = 1.65 to 5.5		10	ns/V
		Control input	V _{CCA} (V) = 1.4 to 3.6	V _{CCB} (V) = 1.65 to 5.5		10	ns/V
T _A	Operating free-air temperature				–40	85	°C

(1) V_{CCI} is the V_{CC} associated with the data input port.

(2) V_{CCO} is the V_{CC} associated with the output port.

(3) V_{CCA} must be less than or equal to V_{CCB}, and V_{CCA} must not exceed 3.6 V.

6.4 Thermal Information

9 Detailed Description

9.1 Overview

The TXS0108E device is a directionless voltage-level translator specifically designed for translating logic voltage levels. The A-port accepts I/O voltages ranging from 1.4 V to 3.6 V. The B-port accepts I/O voltages from 1.65 V to 5.5 V. The device uses pass gate architecture with edge rate accelerators (one shots) to improve the overall data rate. The pull-up resistors, commonly used in open-drain applications, have been conveniently integrated so that an external resistor is not needed. While this device is designed for open-drain applications, the device can also translate push-pull CMOS logic outputs.

9.2 Functional Block Diagram

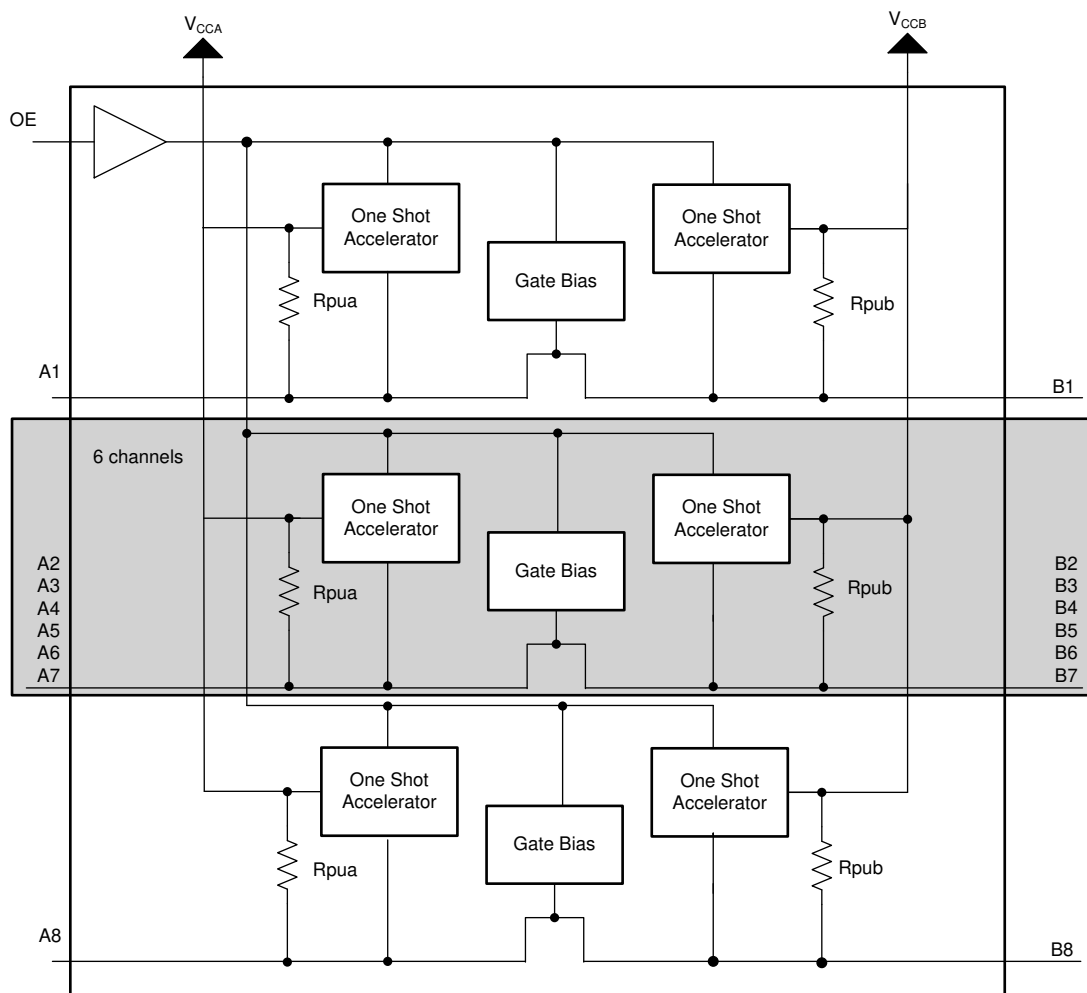

Figure 8. Functional Block Diagram

Each A-port I/O has a pull-up resistor (R_{PUA}) to V_{CCA} and each B-port I/O has a pull-up resistor (R_{PUB}) to V_{CCB} . R_{PUA} and R_{PUB} have a value of 40 k Ω when the output is driving low. R_{PUA} and R_{PUB} have a value of 4 k Ω when the output is driving high. R_{PUA} and R_{PUB} are disabled when OE = Low.

9.3 Feature Description

9.3.1 Architecture

Figure 9 describes semi-buffered architecture design this application requires for both push-pull and open-drain mode. This application uses edge-rate accelerator circuitry (for both the high-to-low and low-to-high edges), a high-on-resistance N-channel pass-gate transistor (on the order of 300 Ω to 500 Ω) and pull-up resistors (to provide DC-bias and drive capabilities) to meet these requirements. This design needs no direction-control signal (to control the direction of data flow from A to B or from B to A). The resulting implementation supports both low-speed open-drain operation as well as high-speed push-pull operation.

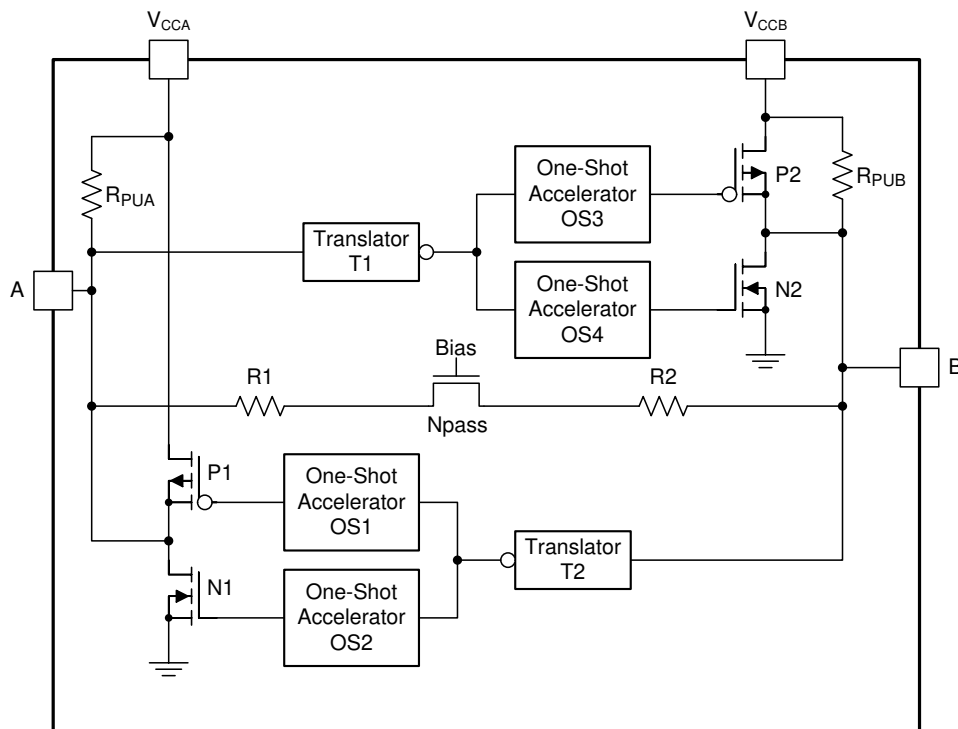

Figure 9. Architecture of a TXS0108E Cell

When transmitting data from A-ports to B-ports, during a rising edge the one-shot circuit (OS3) turns on the PMOS transistor (P2) for a short-duration which reduces the low-to-high transition time. Similarly, during a falling edge, when transmitting data from A to B, the one-shot circuit (OS4) turns on the N-channel MOSFET transistor (N2) for a short-duration which speeds up the high-to-low transition. The B-port edge-rate accelerator consists of one-shot circuits OS3 and OS4. Transistors P2 and N2 and serves to rapidly force the B port high or low when a corresponding transition is detected on the A port.

When transmitting data from B- to A-ports, during a rising edge the one-shot circuit (OS1) turns on the PMOS transistor (P1) for a short-duration which reduces the low-to-high transition time. Similarly, during a falling edge, when transmitting data from B to A, the one-shot circuit (OS2) turns on NMOS transistor (N1) for a short-duration and this speeds up the high-to-low transition. The A-port edge-rate accelerator consists of one-shots OS1 and OS2, transistors P1 and N1 components and form the edge-rate accelerator and serves to rapidly force the A port high or low when a corresponding transition is detected on the B port.

Feature Description (continued)

9.3.2 Input Driver Requirements

The continuous DC-current *sinking* capability is determined by the external system-level open-drain (or push-pull) drivers that are interfaced to the TXS0108E I/O pins. Because the high bandwidth of these bidirectional I/O circuits is used to facilitate this fast change from an input to an output and an output to an input, they have a modest DC-current *sourcing* capability of hundreds of micro-amperes, as determined by the internal pull-up resistors.

The fall time (t_{fA} , t_{fB}) of a signal depends on the edge-rate and output impedance of the external device driving TXS0108E data I/Os, as well as the capacitive loading on the data lines.

Similarly, the t_{PHL} and maximum data rates also depend on the output impedance of the external driver. The values for t_{fA} , t_{fB} , t_{PHL} , and maximum data rates in the data sheet assume that the output impedance of the external driver is less than 50 Ω .

9.3.3 Output Load Considerations

TI recommends careful PCB layout practices with short PCB trace lengths to avoid excessive capacitive loading and to ensure that proper one-shot triggering takes place. PCB signal trace-lengths should be kept short enough such that the round trip delay of any reflection is less than the one-shot duration. This improves signal integrity by ensuring that any reflection sees a low impedance at the driver. The one-shot circuits have been designed to stay on for approximately 30 ns. The maximum capacitance of the lumped load that can be driven also depends directly on the one-shot duration. With very heavy capacitive loads, the one-shot can time-out before the signal is driven fully to the positive rail. The one-shot duration has been set to best optimize trade-offs between dynamic I_{CC} , load driving capability, and maximum bit-rate considerations. Both PCB trace length and connectors add to the capacitance of the TXS0108E output. Therefore, TI recommends that this lumped-load capacitance is considered in order to avoid one-shot retriggering, bus contention, output signal oscillations, or other adverse system-level affects.

9.3.4 Enable and Disable

The TXS0108E has an OE pin input that is used to disable the device by setting the OE pin low, which places all I/Os in the Hi-Z state. The disable time (t_{dis}) indicates the delay between the time when the OE pin goes low and when the outputs actually get disabled (Hi-Z). The enable time (t_{en}) indicates the amount of time the design must allow for the one-shot circuitry to become operational after the OE pin goes high.

9.3.5 Pull-up or Pull-down Resistors on I/O Lines

The TXS0108E has the smart pull-up resistors dynamically change value based on whether a low or a high is being passed through the I/O line. Each A-port I/O has a pull-up resistor (R_{PUA}) to V_{CCA} and each B-port I/O has a pull-up resistor (R_{PUB}) to V_{CCB} . R_{PUA} and R_{PUB} have a value of 40 k Ω when the output is driving low. R_{PUA} and R_{PUB} have a value of 4 k Ω when the output is driving high. R_{PUA} and R_{PUB} are disabled when OE = Low. This feature provides lower static power consumption (when the I/Os are passing a low), and supports lower V_{OL} values for the same size pass-gate transistor, and helps improve simultaneous switching performance.

9.4 Device Functional Modes

The TXS0108E device has two functional modes, enabled and disabled. To disable the device set the OE pin input low, which places all I/Os in a high impedance state. Setting the OE pin input high enables the device.

10 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

10.1 Application Information

The TXS0108E can be used in level-translation applications for interfacing devices or systems operating at different interface voltages with one another. The device is ideal for use in applications where an open-drain driver is connected to the data I/Os. The device is appropriate for applications where a push-pull driver is connected to the data I/Os, but the TXB0104 device, (SCES650) *4-Bit Bidirectional Voltage-Level Translator* might be a better option for such push-pull applications. The device is a semi-buffered auto-direction-sensing voltage translator design is optimized for translation applications (for example, MMC Card Interfaces) that require the system to start out in a low-speed open-drain mode and then switch to a higher speed push-pull mode.

10.2 Typical Application

Figure 10. Typical Application Circuit

10.2.1 Design Requirements

For this design example, use the parameters listed in Table 1. Ensure that $V_{CCA} \leq V_{CCB}$.

Table 1. Design Parameters

DESIGN PARAMETER	EXAMPLE VALUE
Input voltage range	1.4 V to 3.6 V
Output voltage range	1.65 V to 5.5 V

10.2.2 Detailed Design Procedure

To begin the design process, determine the following:

- Input voltage range
 - Use the supply voltage of the device that is driving the TXS0108E device to determine the input voltage range. For a valid logic high the value must exceed the V_{IH} of the input port. For a valid logic low the value

must be less than the V_{IL} of the input port.

- Output voltage range
 - Use the supply voltage of the device that the TXS0108E device is driving to determine the output voltage range.
 - The TXS0108E device has smart internal pull-up resistors. External pull-up resistors can be added to reduce the total RC of a signal trace if necessary.
- An external pull-down resistor decreases the output VOH and VOL. Use Equation 1 to calculate the VOH as a result of an external pull-down resistor.

$$V_{OH} = V_{CCX} \times R_{PD} / (R_{PD} + 4 \text{ k}\Omega) \quad (1)$$

10.2.3 Application Curves

$$V_{CCA} = 1.8 \text{ V}$$

$$V_{CCB} = 3.3 \text{ V}$$

Figure 11. Level-Translation of a 2.5-MHz Signal

11 Power Supply Recommendations

During operation, ensure that $V_{CCA} \leq V_{CCB}$ at all times. The sequencing of each power supply will not damage the device during the power up operation, so either power supply can be ramped up first. The output-enable (OE) input circuit is designed so that it is supplied by V_{CCA} and when the (OE) input is low, all outputs are placed in the high-impedance state. To ensure the high-impedance state of the outputs during power up or power down, the OE input pin must be tied to GND through a pull-down resistor and must not be enabled until V_{CCA} and V_{CCB} are fully ramped and stable. The minimum value of the pull-down resistor to ground is determined by the current-sourcing capability of the driver.

12 Layout

12.1 Layout Guidelines

To ensure reliability of the device, following common printed-circuit board layout guidelines is recommended.

- Bypass capacitors should be used on power supplies. Place the capacitors as close as possible to the VCCA, VCCB pin and GND pin.
- Short trace lengths should be used to avoid excessive loading.
- PCB signal trace-lengths must be kept short enough so that the round-trip delay of any reflection is less than the one shot duration, approximately 30 ns, ensuring that any reflection encounters low impedance at the source driver.

12.2 Layout Example

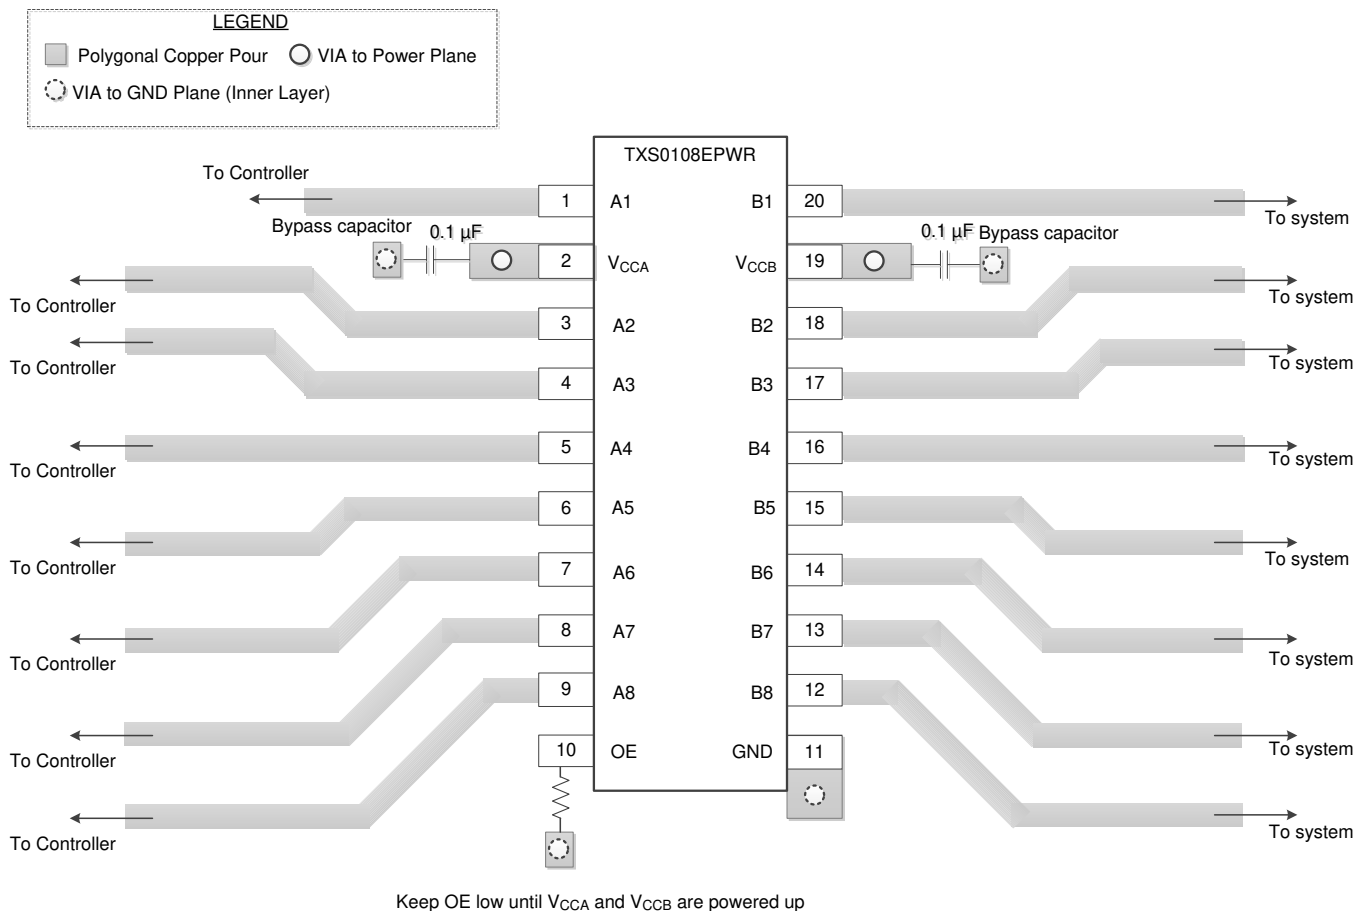

Figure 12. Layout Example

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSELETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

GENERIC PACKAGE VIEW

RGY 20

VQFN - 1 mm max height

3.5 x 4.5, 0.5 mm pitch

PLASTIC QUAD FGLATPACK - NO LEAD

This image is a representation of the package family, actual package may vary.
Refer to the product data sheet for package details.

4225264/A

4225320/A 09/2019

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for thermal and mechanical performance.

EXAMPLE BOARD LAYOUT

RGY0020A

VQFN - 1 mm max height

PLASTIC QUAD FLATPACK - NO LEAD

LAND PATTERN EXAMPLE
EXPOSED METAL SHOWN
SCALE:18X

4225320/A 09/2019

NOTES: (continued)

- This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 (www.ti.com/lit/slua271).
- Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.

EXAMPLE STENCIL DESIGN

RGY0020A

VQFN - 1 mm max height

PLASTIC QUAD FLATPACK - NO LEAD

SOLDER PASTE EXAMPLE
 BASED ON 0.125 mm THICK STENCIL

EXPOSED PAD 21
 78% PRINTED SOLDER COVERAGE BY AREA UNDER PACKAGE
 SCALE:20X

4225320/A 09/2019

NOTES: (continued)

6. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.

4224888/B 08/2019

NOTES:

NanoFree is a trademark of Texas Instruments.

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.

LAND PATTERN EXAMPLE
SCALE: 20X

SOLDER MASK DETAILS
NOT TO SCALE

4224888/B 08/2019

NOTES: (continued)

- Final dimensions may vary due to manufacturing tolerance considerations and also routing constraints. Refer to Texas Instruments Literature number SNVA009 (www.ti.com/lit/snva009).

EXAMPLE STENCIL DESIGN

NME0020A

NFBGA - 0.8 mm max height

PLASTIC BALL GRID ARRAY

SOLDER PASTE EXAMPLE
BASED ON 0.100 mm THICK STENCIL
SCALE: 20X

4224888/B 08/2019

NOTES: (continued)

4. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release.

4220206/A 02/2017

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 mm per side.
4. This dimension does not include interlead flash. Interlead flash shall not exceed 0.25 mm per side.
5. Reference JEDEC registration MO-153.

EXAMPLE BOARD LAYOUT

PW0020A

TSSOP - 1.2 mm max height

SMALL OUTLINE PACKAGE

LAND PATTERN EXAMPLE
EXPOSED METAL SHOWN
SCALE: 10X

4220206/A 02/2017

NOTES: (continued)

6. Publication IPC-7351 may have alternate designs.

7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

EXAMPLE STENCIL DESIGN

PW0020A

TSSOP - 1.2 mm max height

SMALL OUTLINE PACKAGE

SOLDER PASTE EXAMPLE
BASED ON 0.125 mm THICK STENCIL
SCALE: 10X

4220206/A 02/2017

NOTES: (continued)

8. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
9. Board assembly site may have different recommendations for stencil design.
